interest in the problem of interaction between radiation and astrophysical plasmas arose decades ago initially this was closely related to the discovery of radio emission from the sun and galaxy which alerted theoretical radio astronomers to the problem of the origin of extra terrestrial radio emission it has been found that the observed radio emission from cosmic sources is generated by virtue of the mechanisms which work mainly in plasma an ionized gas recently the theory of generation and propagation of radiation in astrophysical plasmas has outgrown its parent domain of theoretical radio astronomy and is being successfully applied to other fields such as high energy astrophysics general results obtained in this field may also help to better understand the complicated phenomena in laboratory plasmas on the earth at the same time analysis of interaction between radiation and astrophysical plasmas under extreme conditions strong magnetic fields of white dwarfs and neutron stars or strong gravitational fields in the vicinity of black holes stimulates the development of plasma physics as a whole in fact the physics of plasma under extreme conditions in space is a new branch of fundamental science the monograph contains the description of physical processes involved in interaction between radiation and astrophysical plasmas it comprises the reasonable minimum necessary for understanding the emission and propagation of electromagnetic waves in astrophysical plasmas without this minimum one could not succeed in interpreting the results of a number of astronomical observations audience this monograph will be useful for graduate and post graduate students and young scientists as a textbook on plasma astrophysics and the issues of plasma physics dealing with radiation at the same time the book can be used by specialists on astrophysics radio astronomy and plasma physics

h j beyer and h kleinpoppen during the preparation of parts a and b of progress in atomic spectroscopy a few years ago it soon became obvious that a comprehensive review and description of this field of modern atomic physics could not be achieved within the limitations of a two volume book while it was possible to include a large variety of spectroscopic methods inevitably some fields had to be cut short or left out altogether other fields have developed so rapidly that they demand full cover in an additional volume one of the major problems already encountered during the preparation of the first volumes was to keep track of new developments and approaches which result in spectroscopic data we have to look far beyond the area of traditional atomic spectroscopy since methods of atomic and ion collision physics nuclear physics and even particle physics all make important contributions to our knowledge of the static and dynamical state of atoms and ions and thereby greatly add to the continuing fascination of a field of research which has given us so much fundamental knowledge since the middle of the last century in this volume we have tried to strike a balance between contributions belonging to the more established fields of atomic structure and spectroscopy and those fields where atomic spectroscopy overlaps with other areas
