shells and plates are critical structures in numerous engineering applications analysis and design of these structures is of continuing interest to the scientific and engineering communities accurate and conservative assessments of the maximum load

carried by a structure as well as the equilibrium path in both the elastic and inelastic range are of paramount importance to the engineer the elastic behavior of shells has been closely investigated mostly by means of the finite element method inelastic analysis however especially accounting for damage effects has received much less attention from researchers in this book we present a computational model for finite element elasto plastic and damage analysis of thin and thick shells formulation of the model proceeds in several stages first we develop a theory for thick spherical shells providing a set of shell constitutive equations these equations incorporate the effects of transverse shear deformation initial curvature and radial stresses the proposed shell equations are conveniently used in finite element analysis A simple quadrilateral doubly curved shell element is developed by means of a quasi conforming technique shear and membrane locking are prevented the element stiffness matrix is given explicitly making the formulation computationally efficient we represent the elasto plastic behavior of thick shells and plates by means of the non layered model using an updated lagrangian method to describe a small strain geometric non linearity for the treatment of material non linearities we adopt an illiushin s yield function expressed in terms of stress resultants with isotropic and kinematic hardening rules

the design of many structures such as pressure vessels aircrafts bridge decks dome roofs and missiles is based on the theories of plates and shells the degree of simplification needed to adopt the theories to the design of various structures depends on the type of structure and the required accuracy of the results hence a water storage tank can be satisfactorily designed using the membrane shell theory which disregards all bending moments whereas the design of a missile casing requires a more precise analysis in order to minimize weight and materials similarly the design of a nozzle to cylinder junction in a nuclear reactor may require a sophisticated finite element analysis to prevent fatigue failure while the same junction in an air accumulator in a gas station is designed by simple equations that satisfy equilibrium conditions accordingly this book is written for engineers interested in the theories of plates and shells and their proper application to various structures the examples given throughout the book subsequent to derivation of various theories are intended to show the engineer the level of analysis required to achieve a safe design with a given degree of accuracy the book covers three general areas these are bending of plates membrane and bending theories of shells and buckling of plates and shells bending of plates is discussed in five chapters chapters 1 and 2 cover rectangular plates with various boundary and loading conditions

from the reviews a unique feature of this book is the nice blend of engineering vividness and mathematical rigour the authors are to be congratulated for their valuable contribution to the literature in the area of theoretical thermoelasticity and vibration of plates journal of sound and vibration

this monograph describes some approaches to the nonlinear theory of plates and shells by nonclassical approaches we mean the description of problems with mathematical models of different sizes two and three dimensional differential equations and different types differential equations of hyperbolic and parabolic type in the spatial coordinates the nonlinearities investigated are also of various categories geometrical physical elasto plastic and periodic creating such types of mathematical models and their detailed justification allows us to achieve the most accurate description of the real behaviour of shell type structures these models allow us to include interaction between the strain and temperature fields and coupling between the displacement field and the external influence of a transonic gas flow the mathematical treatment of such models helps us greatly in obtaining reliable results by numerical computation it appears that the most dangerous situation for thin shallow shells is the conjunction

of a static load with dynamic interactions such combined loads very often cause buckling of shell structures and in many cases a series of bucklings which can cause fracture the failure of a structure usually needs a small amount of time therefore the lifetime of a shell structure depends strongly on nonelastic deflections and it is important to mathematically model shell structures as precisely as possible this monograph is one of several devoted to this subject now we shall briefly describe the contents of the book note that not all of the results presented here have been published in textbook format

this book by a renowned structural engineer offers comprehensive coverage of both static and dynamic analysis of plate behavior including classical numerical and engineering solutions it contains more than 100 worked examples showing step by step how the various types of analysis are performed

in recent years powerful engineering workstations for a reasonable price become a valuable tool for the design of complicated constructions such as shell and spatial structures this availability causes an increasing use of advanced numerical techniques for the static and dynamic analysis of these structures also in the non linear range the i a s s working group no 13 concerned with numerical methods in shell and spatial structures and the department of civil engineering of the katholieke universiteit leuven have taken the initiative to organise an international symposium providing a forum for discussion and exchange of views between researchers specialists in numerical analysis on one hand and designers practising engineer ings on the other hand these proceedings contain the papers presented at the symposium held in leuven july 14 16 1986 the papers are organised in five sections 1 shell structures 2 spatial structures 3 dynamic analysis 4 non linear analysis 5 presentation and interpretation of results the papers covering more than one domain are classified following the main subject we hope that researchers as well as practising engineers will find a lot of useful information in the book
