this comprehensive issue on substance abuse in youth begins with articles on epidemiological trends genetic risk factors neurobiology of substance use disorders and race and gender associations and then provides detailed reviews on prevention and various treatment methodologies treatments discussed include individual and group interventions motivational interviewing and cognitive behavioral therapy contingency reinforcement multidimensional family therapy

pharmacotherapy and post treatment aftercare also reviewed in detail are substance use disorders and psychiatric comorbidity the issue then takes a close look at two emerging areas of concern in youth gambling and internet occupation and energy drink use by all accounts a must read issue for psychiatrists everywhere

the purpose of this collection is to provide a forum to integrate pre clinical and clinical investigations regarding the long term consequences of adolescent exposure to drugs of abuse adolescence is characterized by numerous behavioral and biological changes including substantial neurodevelopment behaviorally adolescents are more likely to engage in risky activities and make impulsive decisions as such the majority of substance use begins in adolescence and an earlier age of onset of use 15 yr is strongly associated with the risk for developing a substance use disorder later in life furthermore adolescent drug use may negatively impact ongoing neurological development which could lead to long term cognitive and emotional deficits a large number of clinical studies have investigated both the acute and long term effects of adolescent drug use on functional outcomes however the clinical literature contains many conflicting findings and is often hampered by the inability to know if functional differences existed prior to drug use moreover in human populations it is often very difficult to control for the numerous types of drugs doses and combinations used not to mention the many other environmental factors that may influence adult behavior therefore an increase in the number of carefully controlled studies using relevant animal models has the potential to clarify which adolescent experiences particularly what drugs used when have long term negative consequences despite the advantages of animal model systems in clarifying these issues the majority of pre clinical addiction research over the past 50 years has been conducted in adult animals moreover few addiction related studies have investigated the long term neurocognitive consequences of drug exposure at any age in the past 10 years of so however the field of adolescent drug abuse research has burgeoned to date the majority of this research has focused on adolescent alcohol exposure using a variety of animal models the results have given the field important insight into why adolescents are more likely to drink alcohol to excess relative to adults and the danger of adolescent alcohol use e g in leading to a persistence of excessive drinking in adulthood more recently research regarding the effects of adolescent exposure to other drugs of abuse including nicotine cocaine and cannabinoids has expanded therefore we are at unique point in time when emerging results from carefully controlled pre clinical studies can inform the sometimes confusing clinical literature in addition we expect an influx of prospective clinical studies in response to a cross institute initiative at nih known as the abcd grant several institutes are enrolling children prior to adolescence and the initiation of drug use in order to control for pre existing neurobiological and neurobehavioral differences and to monitor the age of initiation and amount of drug used more carefully than is possible using retrospective designs
